

**Amendments to the Claims:**

This listing of claims will replace all prior versions, and listings, of claims in the application:

**Listing of Claims:**

1. (currently amended) A method for enhancing security of network transactions, comprising:  
~~receiving, over a public Internet, information relating to a pending transaction between a vendor server and a client;~~  
receiving private network access information for accessing a private network and a transaction identifier from a transaction server system;  
provisioning a set of computer readable instructions with transaction-specific information comprising said transaction identifier and said private network access information;  
~~sending a message addressed to said client over said public Internet with [[a]] said set of computer readable instructions having said transaction-specific information, said set of computer readable instructions comprising access instructions for connecting said client to [[a]] said transaction server system on [[a]] said private network such that sensitive information relating to said transaction is directed to said transaction server system.~~
2. (cancelled)
3. (cancelled)
4. (currently amended) The method of claim [[3]] 1 wherein said information relating to a pending transaction comprises a vendor identifier, ~~said transaction identifier~~, and a purchase amount.
5. (Original) The method of claim 4 wherein said private network access information comprises a flat rate telephone number.

Appl. No. 10/081,265  
Group Art Unit: 3621  
Amdt. Dated February 10, 2006  
Reply to Office Action of September 30, 2005

6. (Original) The method of claim 4 wherein said private network access information comprises a fixed charge per minute telephone number and a number of minutes.
7. (currently amended) The method of claim [[2]] 1 wherein further comprising, prior to said sending, comprises sending a location of said set of computer readable instructions over said public Internet.
8. (Original) The method of claim 7 wherein said location is a universal resource locator (“URL”).
9. (Original) The method of claim 7 wherein said location of said set of computer readable instructions is sent to one of said vendor server and said client.
10. (Original) The method of claim 1 wherein said set of computer readable instructions comprise a first code segment which, when loaded into a processor of said client, cause said client to access said transaction server system on said private network.
11. (Original) The method of claim 10 wherein said set of computer readable instructions comprise a second code segment which, when loaded into said processor of said client, cause said client to pass said transaction-specific information to said transaction server system.
12. (currently amended) A method for enhancing security of network transactions, comprising:  
receiving, over a public Internet, information relating to a pending transaction between a vendor server and a client;  
sending a message addressed to said client over said public Internet with a set of computer readable instructions having transaction-specific information, said set of computer readable instructions comprising access instructions for connecting said client to a transaction server system

on a private network such that sensitive information relating to said transaction is directed to said transaction server system;

~~The method of claim 2~~ wherein said message is a transaction message and further comprising, prior to said sending said transaction message, sending a set-up message addressed to said client over said public Internet with a set of computer executable instructions for determining resources of said client for connecting to said private network.

13. (currently amended) The method of claim 12 further comprising receiving from said client over said public Internet an indication of resources of said client and ~~wherein said provisioning said set of computer readable instructions is based, in part, on said indication of resources.~~

14. (currently amended) The method of claim [[2]] 1 wherein said set of computer readable instructions further comprises instructions for determining resources of said client for connecting to said private network.

15. (currently amended) The method of claim [[3]] 1 further comprising sending said information relating to a pending transaction to said transaction server system over a secure link prior to said receiving a transaction identifier and private network access information.

16. (Original) The method of claim 4 wherein said information relating to a pending transaction further comprises a location of a data product which is subject of said pending transaction and access codes for use in accessing said data product.

17. (Original) The method of claim 4 wherein said information relating to a pending transaction includes an internet protocol (“IP”) address of said client and wherein said private network access information comprises an IP address which an internet service provider (“ISP”) of said client maps to a port connected over said private network to said transaction server system.

18. (Original) The method of claim 1 wherein said receiving and said sending are performed at a web server and further comprising, at a transaction server system:

receiving customer-sensitive information and transaction identification information consequent upon execution of said set of computer readable instructions at a client;  
selectively sending transaction approval information.

19. (Original) A computer-readable medium storing statements and instructions for use in the execution in a web server of the method of claim 1.

20. (Original) A web server adapted for performing the method of claim 1.

21. (Original) A method for enhancing security of network purchase transactions, comprising:  
receiving, over a public Internet, information relating to a pending purchase transaction between a vendor server and a client;

sending a message addressed to said client over said public Internet with a set of computer executable instructions for determining resources of said client for connecting to a private network.

22. (previously presented) A method for enhancing security of network transactions, comprising:  
receiving information relating to a pending transaction over a secure link, said information including access information for a data product, and a purchase amount;

determining an appropriate chargeable telephone number based upon said purchase amount;

storing a transaction identifier, said telephone number, and said access information; and returning said transaction identifier and said telephone number over said secure link.

Appl. No. 10/081,265  
Group Art Unit: 3621  
Amdt. Dated February 10, 2006  
Reply to Office Action of September 30, 2005

23. (Original) The method of claim 22 further comprising:

receiving a telephone call made to said telephone number from a caller;  
during said call, receiving caller identity information;  
during said call, receiving said transaction identifier;  
storing said caller identity information with said transaction identifier;  
providing said access information to said data product to said caller.

24. (Original) The method of claim 23 wherein said telephone number is a flat rate number.

25. (Original) The method of claim 23 wherein said telephone number is a fixed charge per minute number and wherein said determining further comprises determining a number of minutes based on said purchase amount and storing said number of minutes.

26. (Original) A computer readable medium storing computer-readable instructions which, when read by a client, cause the client to:

dial and establish a connection to a specific telephone number over a telephone network;  
send a transaction-specific identifier over said connection;  
receive a message over said connection with a universal resource locator (URL) and password;  
drop said connection;  
connect to said URL over a public Internet; and  
display said password.

27. (cancelled)

28. (new) The method of claim 22 wherein said secure link is a data network link.

Appl. No. 10/081,265  
Group Art Unit: 3621  
Amdt. Dated February 10, 2006

29. (new) The method of claim 22 wherein said access information comprises a URL and a password.
30. (new) The method of claim 22 wherein said receiving comprises receiving said transaction identifier.
31. (new) The method of claim 22 wherein said receiving, said determining, said storing, and said returning are undertaken at a transaction server system.
32. (new) The method of claim 31 wherein said receiving is receiving from a facilitation server and said returning is returning to said facilitation server.
33. (new) The method of claim 23 wherein said caller identity information comprises at least one of a caller line identification (CLID) and a calling party name display (CPND).
34. (new) The method of claim 1 wherein said receiving is receiving over a public Internet.
35. (new) The method of claim 16 wherein said information relating to a pending transaction further comprises said transaction identifier.
36. (new) The method of claim 13 wherein said indication of resources indicates said client lacks a modem and wherein said provisioning comprises provisioning said set of computer readable instructions so as to cause a display of said client to display said access instructions and said transaction identifier.
